Any conclusions and/or recommendations herein reflect the judgment of HGC based on information available at the time of preparation and were developed in good faith on information provided by others, as noted in the report, which has been assumed to be factual and accurate. Changed conditions or information occurring or becoming known after the date of this report could affect the results and conclusions presented.

Table of Contents

1 INTRODUCTION AND SUMMARY

HGC Engineering was retained by Bayport Resort Ltd. to conduct a noise feasibility study for a two proposed 12-storey residential buildings located at 1191 Harbourview Drive in Midland, Ontario. The surrounding area is primarily existing residential to the north and south. The Bay Port Yachting Centre is located to the east of the site. A noise study is required by the municipality as part of the planning and approvals process.

The study finds that the traffic noise exceeds the MECP sound level criteria during daytime and nighttime hours at the proposed development. Transportation noise can be mitigated by standard building envelope assemblies. An alternative means of ventilation to open windows are required for the proposed buildings. Air conditioning meets and exceeds this requirement and is likely to be included. Any exterior wall, and double-glazed window construction meeting the minimum requirements of the Ontario Building Code (OBC) will provide adequate sound insulation for all the dwelling units in this development. Noise warning clause are recommended to inform future residents of the sound level excesses and the presence of the nearby marina.

2 SITE DESCRIPTION AND NOISE SOURCES

Figure 1 is a key plan of the site. Figure 2 is the proposed site plan prepared by Chamberlain Architect Services Limited, last revised October 18, 2024. The proposed residential development is to consist of two 12-storey buildings with a connecting 4-storey podium. Supporting drawings are included in Appendix A.

A site visit was conducted on January 15, 2025, to investigate the acoustic environment of the site. Figure 3 includes an aerial photo showing the surrounding land uses. There are existing residences surrounding the site along Harbourview Drive and Bayport Boulevard. To the east of the site is The Bay Port Yachting Centre. There are existing single storey dwellings immediately to the north of the marina and the subject site. To the south of the site are existing 4-storey residential buildings. There are no significant sources of

stationary noise within 500 m of the subject site. Approximately 700 m to the southeast of the subject site is an ADM Milling Company facility located at 202 First St. Sound levels from the facility were not audible at the subject site during the site visit. There are several existing dwellings along Fourth Street and some dwellings south of Bay Street. The closest existing dwelling is within 50 m from the ADM property line. A review of publicly available information indicates ADM does have an active Environmental Compliance Approval (ECA) and as result is required to meet the applicable sound level limits at the surrounding existing residential dwellings which are significantly closer than the subject site. HGC has entered into a confidentiality agreement with ADM to review their acoustic model of their site. We have not yet received the acoustic model and therefore cannot provide further comment. When the acoustic model is available, a supplementary addendum will be provided with regard to noise from the ADM and any potential noise impact.

3 ROAD TRAFFIC NOISE ASSESSMENT

3.1 Road Traffic Noise Criteria

Guidelines for acceptable levels of road traffic noise impacting residential developments are given in the MECP publication NPC-300, “Environmental Noise Guideline Stationary and Transportation Sources – Approval and Planning”, Part C release date October 21, 2013 and are listed in Table 1 below. The values in Table 1 are energy equivalent (average) sound levels [L_{EQ}] in units of A weighted decibels [dBA].

Table 1: Road Traffic Noise Criteria

Space	Daytime $L_{EQ(16\ hour)}$ Road	Nighttime $L_{EQ(8\ hour)}$ Road
Outdoor Living Areas	55 dBA	--
Inside Living/Dining Rooms	45 dBA	45 dBA
Inside Bedrooms	45 dBA	40 dBA

Daytime refers to the period between 07:00 and 23:00, while nighttime refers to the period between 23:00 and 07:00. The term "Outdoor Living Area" (OLA) is used in reference to an outdoor patio, a backyard, a terrace or other area where passive recreation is expected to occur. Balconies that are less than 4 m in depth are not considered to be outdoor living areas under MECP guidelines.

The MECP guidelines allow the daytime sound levels in an OLA to be exceeded by up to 5 dBA, without mitigation, if warning clauses are placed in the purchase and rental agreements to the property. Where OLA sound levels exceed 60 dBA, physical mitigation is recommended to reduce the OLA sound level to below 60 dBA and as close to 55 dBA as technically, economically and administratively feasible.

A central air conditioning system as an alternative means of ventilation to open windows is required for dwellings where nighttime sound levels the façade exceed 60 dBA or daytime sound levels at the façade exceed 65 dBA. If the sound level at the facade is greater than 55 dBA and less than or equal to 65 dBA, the dwelling should be designed with a provision for the installation of central air conditioning in the future, at the occupant's discretion.

Building components such as walls, windows and doors must be designed to achieve indoor sound level criteria when the sound level at the façade is greater than 60 dBA or the daytime sound level is greater than 65 dBA due to road traffic noise.

Warning clauses to notify future residents of possible excesses are also required when nighttime sound levels exceed 50 dBA at the plane of the bedroom window and daytime sound levels exceed 55 dBA in the outdoor living area and at the plane of the living/dining room window due to road traffic.

3.2 Traffic Sound Level Assessment

3.2.1 Road Traffic Data

Road traffic data for Harbourview Drive was obtained from HGC past project files for projects in the area and is included in Appendix B. Harbourview Drive is one lane in each direction. The commercial vehicle percentage was assumed to be 2% split into 1% heavy trucks and 2% medium trucks. A day/night split of 90%/10% was used in assumed along with a 50 km/h speed limit was used in the analysis. Table 2 summarizes the data used in the analysis.

Table 2: Future Road Traffic Data

Roadway	AADT	Day / Night Split [%]	Trucks Percentage (%)		Speed Limit [km/h]
			Medium	Heavy	
Harbourview Drive	16 451	90 / 10	1.0	1.0	50

3.2.2 Road Traffic Noise Predictions

To assess the levels of road traffic noise which would impact the site in the future, road traffic predictions were made using STAMSON version 5.04, a computer algorithm developed by the MECP. Sample STAMSON output is included in Appendix C.

Prediction locations were chosen around the site to obtain a good representation of the future sound levels at the proposed development with exposure to the surrounding roadways. The worst-case prediction locations were chosen at the top storey of the proposed buildings, as indicated in Figure 2. The results of these predictions are summarized in Table 3.

Table 3: Future Road Traffic Sound Levels, [dBA], Without Mitigation

Prediction Location	Description	Daytime in OLA $L_{EQ(16\ hour)}$	Daytime at Façade $L_{EQ(16\ hour)}$	Nighttime at Façade $L_{EQ(8\ hour)}$
[A]	Southwest façade	--	64	58
[B]	Northwest/southeast façade	--	60	54
[C]	Fourth Floor OLA	<55	--	--

3.3 Traffic Noise Recommendations

The predictions indicate that the future traffic sound levels will be within MECP guidelines at the proposed buildings.

3.3.1 Outdoor Living Areas

Balconies may be provided for the proposed buildings. Balconies are not considered to be outdoor amenity areas by the MECP if they are less than 4 m in depth. No sound level predictions are required for these balconies.

There are common outdoor amenity spaces located on the north side of the building on the 4th floor. The predicted sound level in these amenity spaces is less than 55 dBA as the buildings themselves provide shielding from the roadway. No further mitigation is required.

3.3.2 Indoor Living Areas

The predicted future sound levels of the proposed 12-storey buildings have predicted sound levels between 56 and 65 dBA during the daytime hours and between 51 to 60 dBA during the nighttime hours. To address these excesses, these units require an alternative means of ventilation to open windows. Air conditioning meets and exceeds this requirement and likely will be included in any event. The location, installation and sound ratings of the outdoor air conditioning devices should minimize noise impacts and comply with criteria of MECP publication NPC-216.

3.3.3 Building Façade Constructions

Since the daytime and nighttime sound levels at the facades of the residential units will be less than 65 dBA during the day and less than 60 dBA during the night, any exterior wall, and double-glazed window construction meeting the minimum requirements of the Ontario Building Code (OBC) will provide adequate sound insulation for all the dwelling units in this development.

4 WARNING CLAUSES

The MECP guidelines recommend that warning clauses be included in the property and tenancy agreements for all the dwellings with anticipated traffic noise sound level excesses and the presence of the marina. The following noise warning clauses are required.

A suggested wording for future dwellings with sound level excesses of the MECP criteria but do not require physical mitigation measures is given below.

Type A:

> Purchasers/tenants are advised that sound levels due to increasing road traffic may occasionally interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the Ministry of the Environment.

A suggested wording for future dwellings requiring central air conditioning systems is given below.

Type D:

> This dwelling unit has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the Ministry of the Environment.

A suggested wording for dwelling units with exposure to the marina where sound levels will at times be audible is given below.

Type E:

> Purchasers/tenants are advised that due to the proximity of the adjacent Marina, noise from this area may at times be audible.

These sample clauses are provided by the MECP as examples and can be modified by the Municipality as required.

5 IMPACT OF THE DEVELOPMENT ON THE ENVIRONMENT

Sound levels from noise sources such as rooftop air-conditioners, cooling towers, exhaust fans, etc. should not exceed the minimum one-hour L_{EQ} ambient (background) sound level from road traffic, at any potentially impacted residential point of reception. Based on the levels observed during our site visit, the typical minimum ambient sound levels in the area are expected to be around 50 dBA during the day and 45 dBA at night. Thus, any electro-mechanical equipment associated with this development (e.g. emergency generator testing, fresh-air handling equipment, etc.) should be designed such that they do not result in noise impact beyond these ranges.

6 IMPACT OF THE DEVELOPMENT ON ITSELF

Section 5.8.1.1 of the Ontario Building Code (OBC), released on January 1, 2020, specifies the minimum required sound insulation characteristics for demising partitions, in terms of Sound Transmission Class (STC) or Apparent Sound Transmission Class (ASTC) values. In order to maintain adequate acoustical privacy between separate suites in a multi-tenant building, inter-suite walls must meet or exceed STC-50 or ASTC-47. Suite separation from a refuse chute or elevator shaft must meet or exceed STC-55. In addition, it is recommended that the floor/ceiling constructions separating suites from any amenity or commercial spaces also meet or exceed STC-55. Tables 1 and 2 in

Section SB-3 of the Supplementary Guideline to the OBC provide a comprehensive list of constructions that will meet the above requirements.

Tarion's Builder Bulletin B19R requires the internal design of condominium projects to integrate suitable acoustic features to insulate the suites from noise from each other and amenities in accordance with the OBC and limit the potential intrusions of mechanical and electrical services of the building on its residents. If B19R certification is needed, an acoustical consultant is required to review the mechanical and electrical drawings and details of demising constructions and mechanical/electrical equipment, when available, to help ensure that the noise impact of the development on itself is maintained within acceptable levels.

7 SUMMARY

Analysis indicates that the predicted sound level will be within MECP guidelines limits at the proposed buildings. The following recommendations are provided.

1. An alternative means of ventilation to open windows is required for the proposed buidlings. Air conditioning meets and exceeds this requirement and is likely to be included.

2. Any exterior wall, and double-glazed window construction meeting the minimum requirements of the OBC will provide adequate sound insulation for the proposed building.

3. Warning clauses should be used to inform future residents of the sound level excesses and presence of the nearby marina.

4. An acoustical consultant should review the mechanical drawings and details of demising constructions, when available, to help ensure that the noise impact of the development on the environment, and of the development on itself, are maintained within acceptable levels.

5. Tarion's Builder Bulletin (B19R) requires that the internal design of condominium projects integrates suitable acoustic features to insulate the suites from noise from each other and amenities in accordance with the OBC, and limit the potential intrusions of mechanical and electrical services of the buildings on its residents. If B19R certification is needed, an acoustical consultant is required to review the mechanical and electrical drawings and details of demising constructions and mechanical/electrical equipment, when available, to help ensure that the noise impact of the development on itself are maintained within acceptable levels. Outdoor sound emissions should also be checked to ensure compliance with the City's by-law.

The reader is referred to the previous sections of the report where these recommendations are discussed in more detail.

Appendix C
Sample STAMSON 5.04 Output

STAMSON 5.0 NORMAL REPORT Date: 07-03-2025 15:06:54
MINISTRY OF ENVIRONMENT AND ENERGY / NOISE ASSESSMENT

Filename: a.te Time Period: Day/Night 16/8 hours

Description: Southwest facade
Road data, segment # 1: Harbourview (day/night)

Car traffic volume : 14361/1596 veh/TimePeriod *
Medium truck volume : 296/33 veh/TimePeriod *
Heavy truck volume : 148/16 veh/TimePeriod *
Posted speed limit : 50 km/h
Road gradient : 0 %
Road pavement : 1 (Typical asphalt or concrete)

* Refers to calculated road volumes based on the following input:

24 hr Traffic Volume (AADT or SADT): 15276
Percentage of Annual Growth : 2.50
Number of Years of Growth : 3.00
Medium Truck % of Total Volume : 2.00
Heavy Truck % of Total Volume : 1.00
Day (16 hrs) % of Total Volume : 90.00

Data for Segment # 1: Harbourview (day/night)

Angle1 Angle2 : -90.00 deg 90.00 deg
Wood depth : 0 (No woods.)
No of house rows : 0 / 0
Surface : 2 (Reflective ground surface)
Receiver source distance : 16.20 / 16.20 m
Receiver height : 34.50 / 34.50 m
Topography : 1 (Flat/gentle slope; no barrier)
Reference angle : 0.00

Results segment # 1: Harbourview (day)

Source height = 1.00 m

ROAD (0.00 + 64.19 + 0.00) = 64.19 dBA

Angle1	Angle2	Alpha	RefLeq	P.Adj	D.Adj	F.Adj	W.Adj	H.Adj	B.Adj	SubLeq
-90	90	0.00	64.53	0.00	-0.33	0.00	0.00	0.00	0.00	64.19

Segment Leq : 64.19 dBA

Total Leq All Segments: 64.19 dBA
Results segment # 1: Harbourview (night)

```
----------------------------------------

Source height = 0.99 m
